

Q1

Protocol	Packets dropped	Plot
NewReno	38	 <p>The plot titled 'Congestion Window Calculation NewReno' shows the congestion window size over 35 seconds. The y-axis ranges from 0 to 18000. The window size increases in a sawtooth pattern, with peaks reaching approximately 16000. The legend indicates 'New Congestion' with a red line and '+' markers.</p>
HighSpeed	38	 <p>The plot titled 'Congestion Window Calculation HighSpeed' shows the congestion window size over 35 seconds. The y-axis ranges from 0 to 25000. The window size increases in a sawtooth pattern, with peaks reaching approximately 20000. The legend indicates 'New Congestion' with a red line and '+' markers.</p>
Veno	38	 <p>The plot titled 'Congestion Window Calculation Veno' shows the congestion window size over 35 seconds. The y-axis ranges from 0 to 18000. The window size increases in a sawtooth pattern, with peaks reaching approximately 16000. The legend indicates 'New Congestion' with a red line and '+' markers.</p>

Observations:

The SMSS is the size of the largest segment that the sender can transmit.

Newreno:

- Congestion avoidance – congestion window is increased by 1 full sized segment
- Slow start – congestion window is increased by $\min(\text{number of bytes unacknowledged}, \text{maximum segment size})$
- We can see that till ssthresh value the points are separated by much larger distance that is jump is higher. But when ssthresh is reached points are close as the increment is by 1 – fixed.

HighSpeed:

- Designed for high capacity channels, with large congestion windows.
- Cwnd grows much faster and accelerates from recovery faster.
- We see much higher jumps in the plot.
- The average window size is higher compare with any other protocol

Vegas:

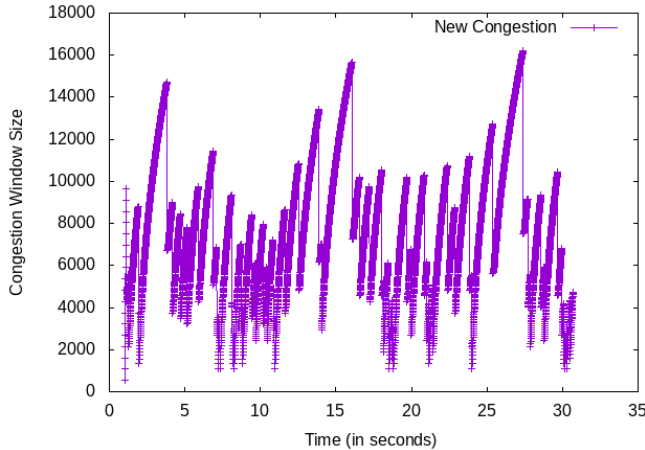

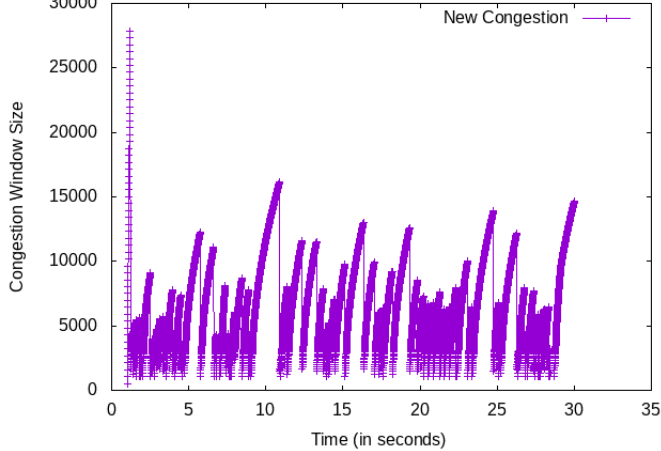

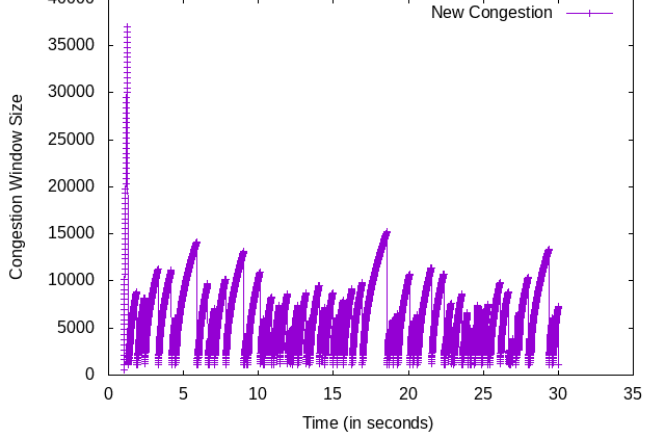

- Delay based congestion control protocol. Expected and actual throughputs are calculated to get the congestion queue at bottleneck and accordingly cwnd is adjusted
- Linear increase and linear decrease
- Plots show lowest average cwnd size

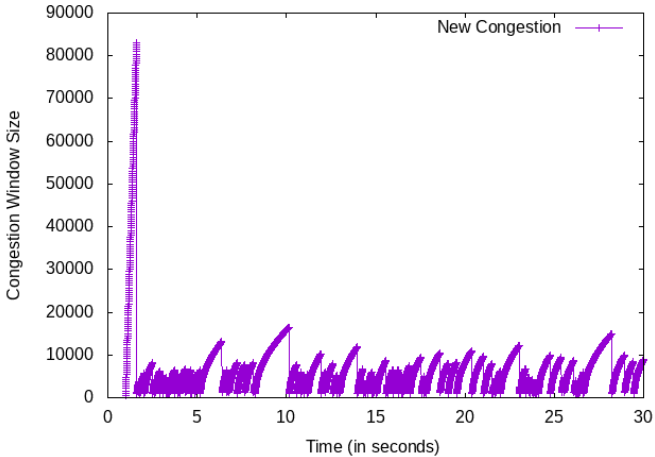

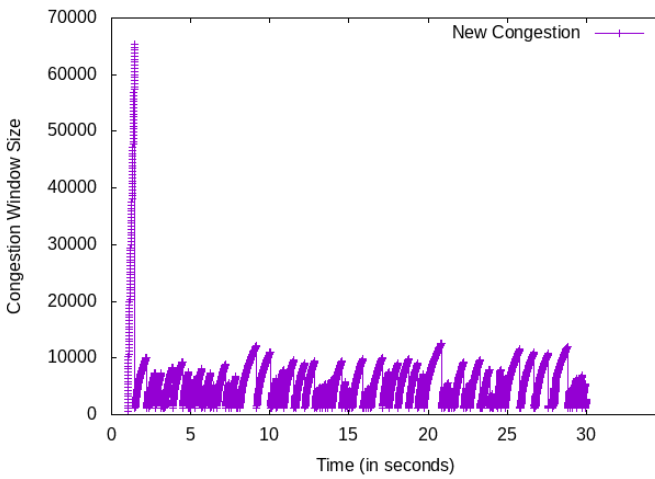

Veno:

- Uses prediction method similar to vegas.
- Refines additive increase algo of reno to increase duration of connection in stable state by increasing cwnd by $1/\text{cwnd}$ for every new ack after bandwidth is fully utilized
- Multiplicative decrease is by $1/5$ as loss is assumed to be more likely due to corruption.
- The average window size is higher compare with any other protocol
- Plot is similar to newreno except for fully utilization part

Q2

A) Different channel rate

Channel data rate	Plot	Packet dropped
2 Mbps	<p>Congestion window size vs time graph for q2-a-2Mbps.cwnd</p> 	66
4 Mbps	<p>Congestion window size vs time graph for q2-a-4Mbps.cwnd</p> 	76
10 Mbps	<p>Congestion window size vs time graph for q2-a-10Mbps.cwnd</p> 	75

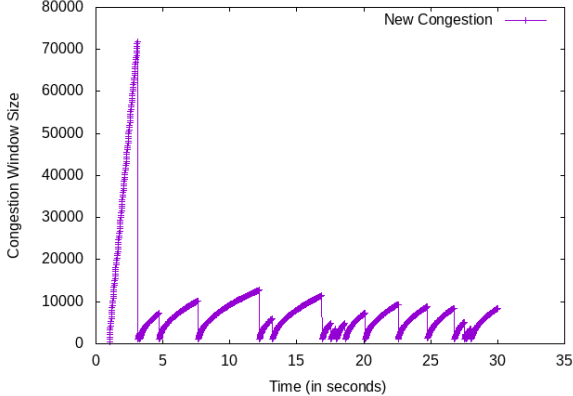

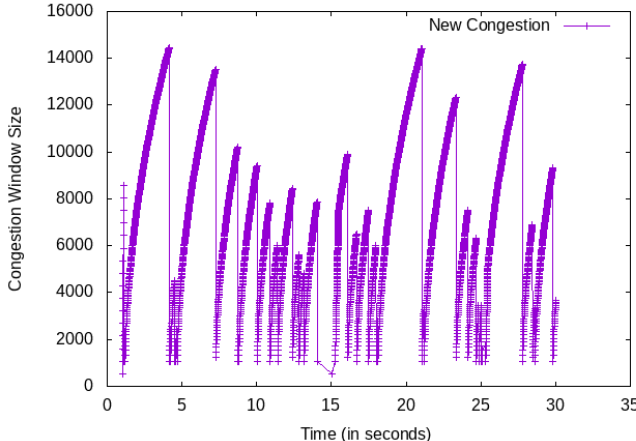

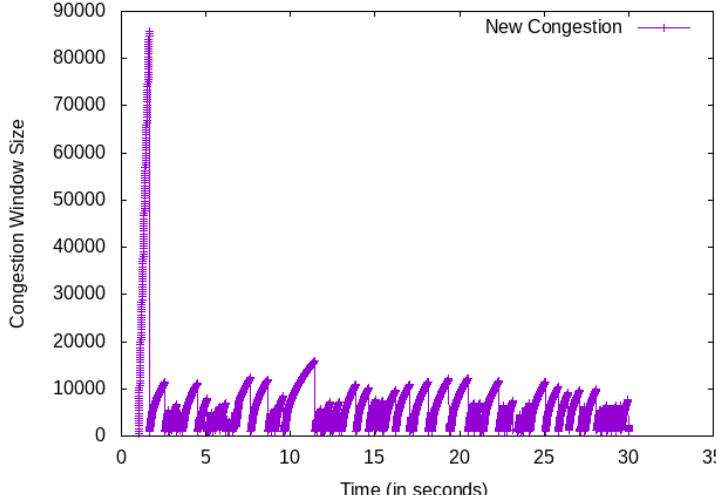

20 Mbps	<p>Congestion window size vs time graph for q2-a-20Mbps.cwnd</p> 	89
50 Mbps	<p>Congestion window size vs time graph for q2-a-50Mbps.cwnd</p> 	96

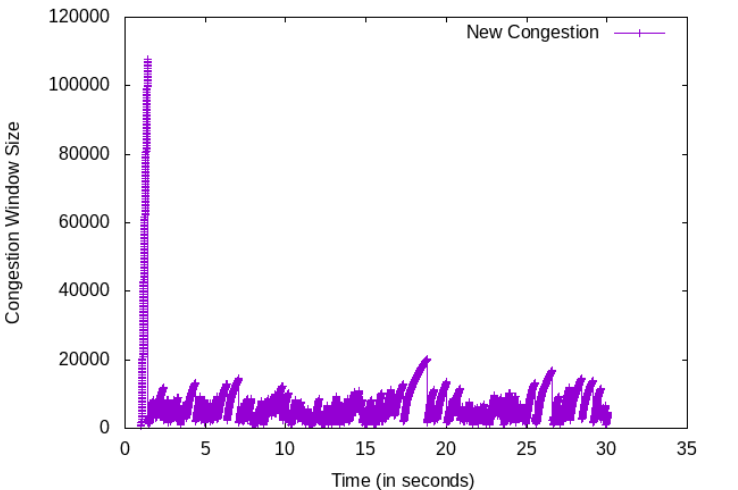

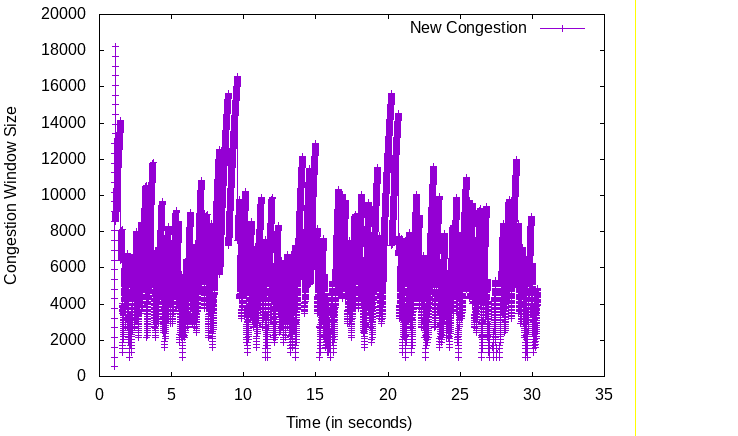

Channel rate is varied but the rate at which application is sending data is constant.

The initial maximum congestion window size varies as 15000, 27000, 37000, 85000, 65000

The total packets loss increases as we increase the channel rate

B) Different application data rate

Channel data rate	Plot	Packet dropped
0.5 Mbps	<p>Congestion window size vs time graph for q2-b-0.5Mbps.cwnd</p> 	17
1 Mbps	<p>Congestion window size vs time graph for q2-b-1Mbps.cwnd</p> 	36
2 Mbps	<p>Congestion window size vs time graph for q2-b-2Mbps.cwnd</p> 	83

4 Mbps	<p style="text-align: center;">Congestion window size vs time graph for q2-b-4Mbps.cwnd</p> 	144
10 Mbps	<p style="text-align: center;">Congestion window size vs time graph for q2-b-10Mbps.cwnd</p> 	179

Here channel rate is fixed but application rate is varied.

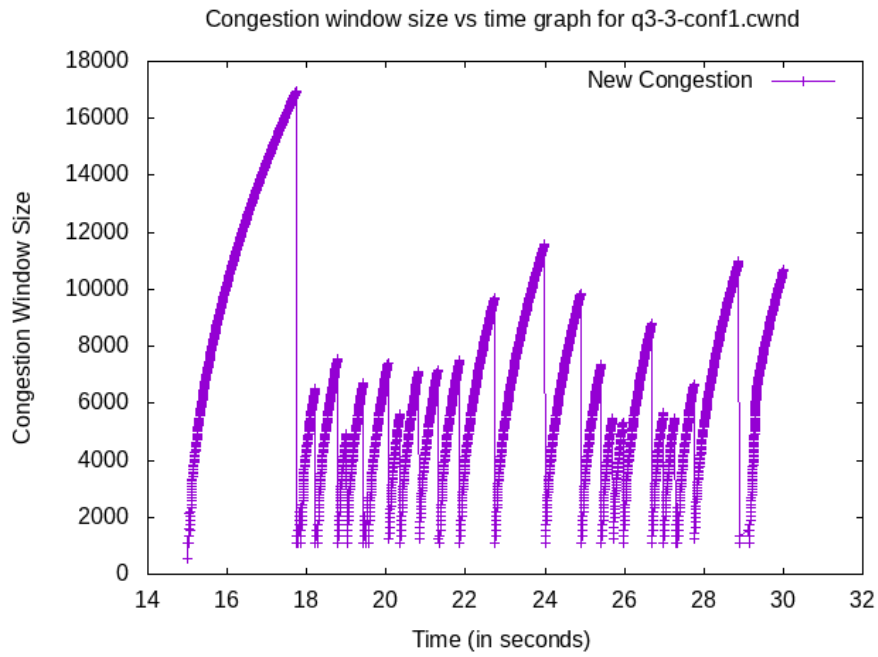

Total number of packets lost increases with the increase in application data rate. Large number of packets lost increases the noise in the graph. This is expected as the channel gets over occupied

Q3

Implementation: By inheritance

Configuration1:

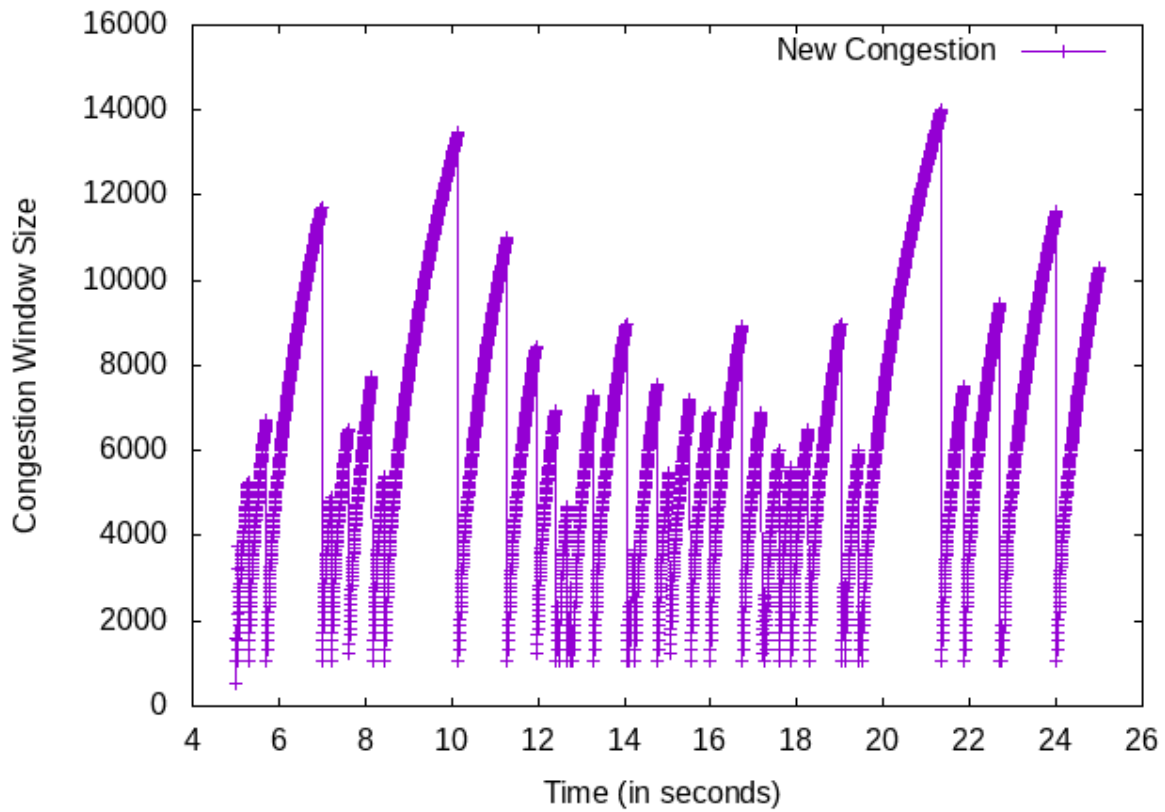

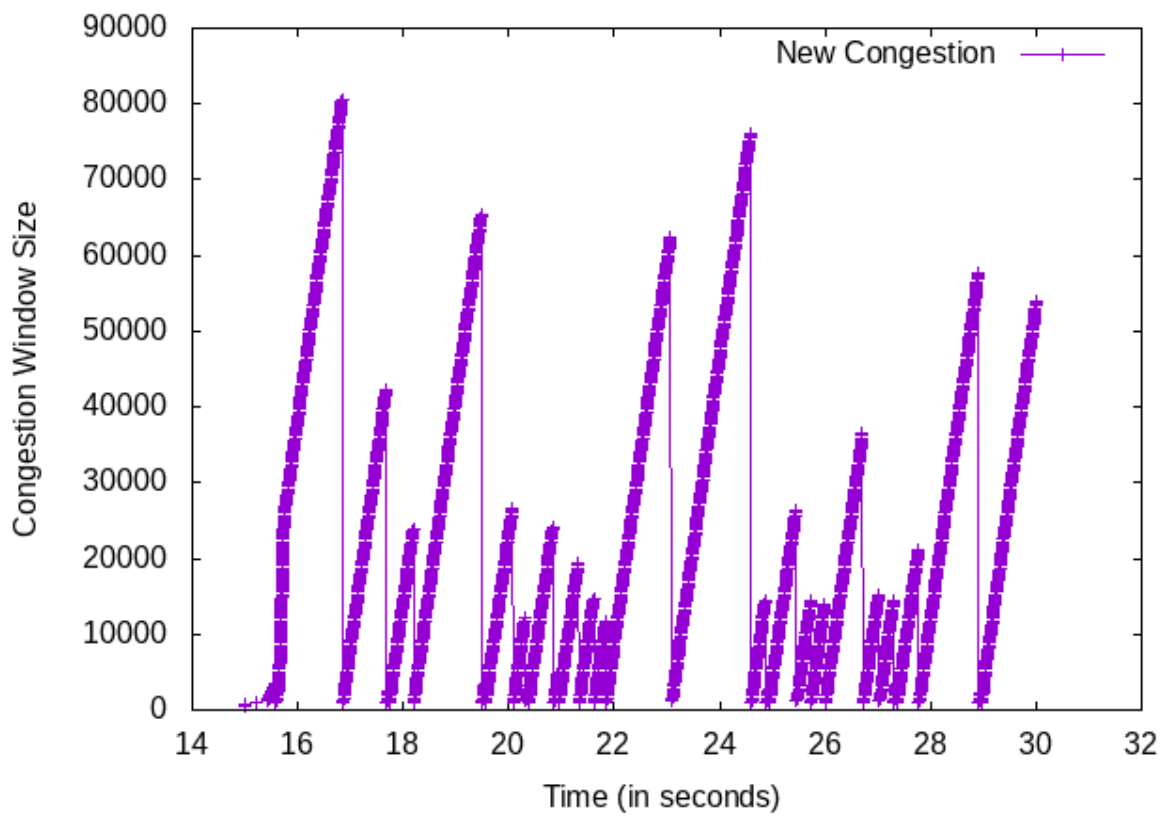

Configuration 2:

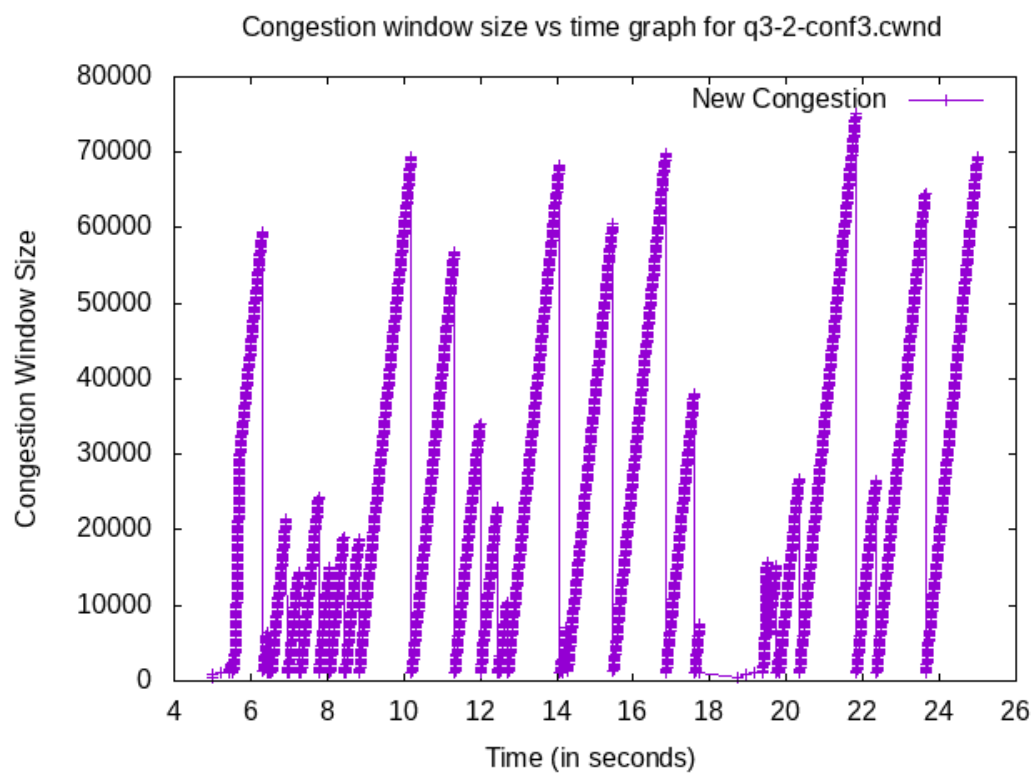

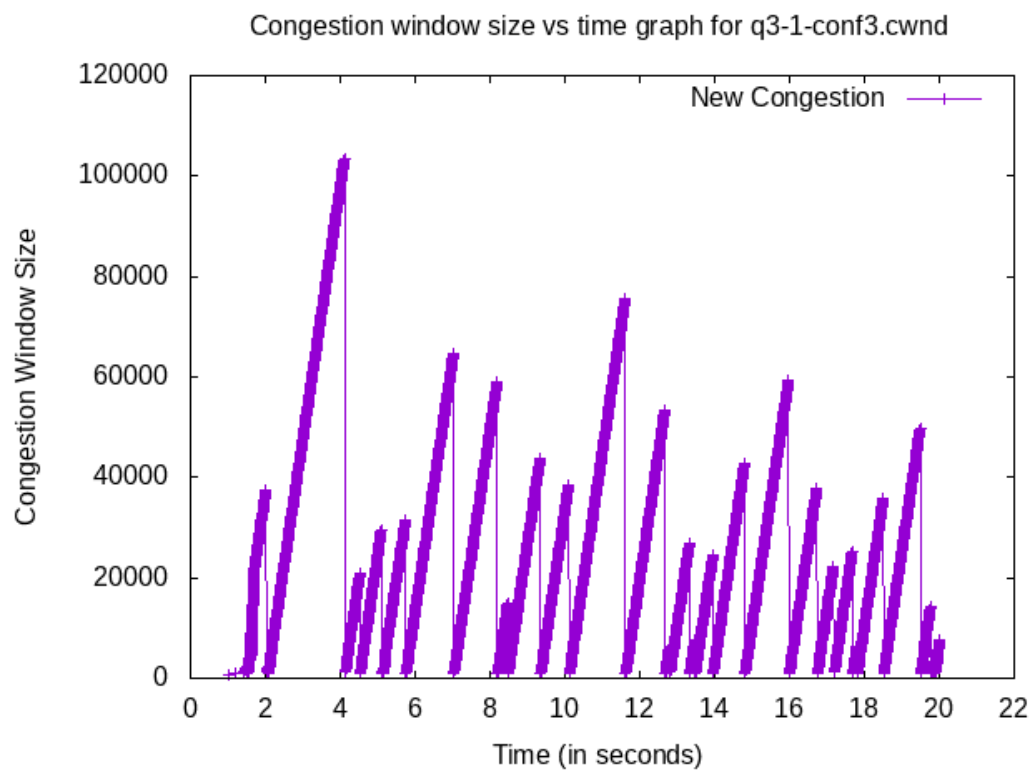

Congestion window size vs time graph for q3-2-conf2.cwnd

Congestion window size vs time graph for q3-3-conf2.cwnd

Configuration 3:

Packet Loss

Config	Channel 1-3 loss	Channel 2-3 loss	Total Loss
1	0	0	0
2	80	30	110
3	72	32	104
